One Year In: How our \$5B investment in IoT and intelligent edge is accelerating customer, partner and solution innovation

Apr 4, 2019 | [Julia White - Corporate Vice President, Microsoft Azure](#)

One year ago, we [announced](#) our commitment to invest \$5B in IoT (Internet of Things) and intelligent edge – technology that is accelerating ubiquitous computing and bringing unparalleled opportunity for transformation across industries. Our commitment is to a build trusted, easy to use platform for our customers and partners to build solutions – no matter where they are starting in their IoT journey.

Our customers are embracing IoT as a core strategy to drive better business outcomes, improve safety and address social issues – from predicting and preventing equipment failures, optimizing smart buildings for space utilization and energy management and improving patient outcomes and worker safety. From the intelligent cloud to the intelligent edge, this year has been one of tremendous growth – in IoT technology portfolio, partner ecosystem and customer momentum – and we are only just beginning.

Accelerating customer innovation in IoT from cloud to edge across industries

What's truly exciting is seeing our customers achieve real business outcomes with Azure IoT and intelligent edge-based solutions. Our IoT platform is powering customer solutions with

The Seven Properties of Highly Secure Devices: the new standard for securing MCU powered IoT experiences

<https://www.microsoft.com/en-us/research/wp-content/uploads/2017/03/SevenPropertiesofHighlySecureDevices.pdf>

THE DEVELOPER'S CONFERENCE

Hardware Root of Trust

Seu dispositivo é identificável e a integridade do software é confirmada por hardware?

Defense In Depth

Seu dispositivo se mantém seguro se um mecanismo de segurança for destruído?

Small Trusted Computing Base

O seu dispositivo esta protegido de erros em outros códigos fonte?

Dynamic Compartments

As proteções de segurança do seu dispositivo podem melhorar após a implantação?

Certificate-Based Authentication

Seu dispositivo utiliza certificados digitais ao invés de senhas para autenticação?

Failure Reporting

Seu dispositivo reporta falhas e anomalias?

Renewable Security

Seu dispositivo atualiza o software de forma automática?

Suporte do Hardware

Suporte do Sistema Operacional

Suporte do Serviço de Nuvem

Algumas necessidades dependem do suporte do hardware

Hardware Root of Trust

Chave criptográfica que não pode ser excluída e protegida pelo hardware. Dispositivos contadores físicos impedem ataques do tipo *side-channel*.

A identidade do dispositivo e o software seguro dentro do hardware

Hardware protege a **Identidade do Dispositivo**

Hardware protege a **Inicialização com Segurança**

Hardware atesta a **Integridade do Sistema**

Algumas necessidades dependem do suporte do hardware e do software

Dynamic Compartments

Barreiras internas limitam o alcance de qualquer falha

Hardware cria **Barreiras de Segurança**

Hardware firewall ou unidades de memória gerenciadas

Software **cria Compartimentos** Isolamento de processos

Algumas necessidades dependem do suporte do hardware e do software

Small Trusted Computing Base

Chave criptográfica são armazenadas em uma carteira protegida pelo hardware, inacessível pelo software.

Hardware protege as **chaves criptográficas de acesso**

A arquitetura de software é **concebida no formato de camadas** impedindo o acesso direto.

Algumas necessidades dependem do suporte do hardware, do software e da nuvem

Renewable Security

A segurança do dispositivo é renovada para superar as ameaças em evolução e as violações de segurança.

Nuvem provê as **atualizações**

Software **aplica as atualizações**

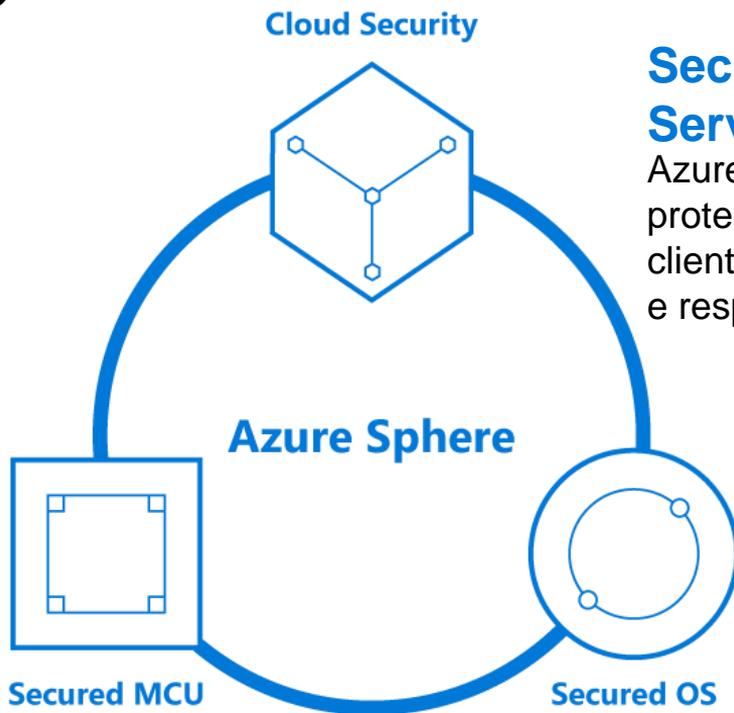

Hardware **previne rollback attacks**

Três pilares de segurança do Azure Sphere

Secured MCUs

Uma nova categoria de MCU's chamado Azure Sphere, produzidos por empresas parceiras, com tecnologia de segurança da Microsoft, que fornece conectividade, alto desempenho e características de segurança no hardware.

Secured by our Cloud Service

Azure Sphere Security Service protege cada dispositivo e os clientes, detecta falhas de segurança e responde de forma proativa.

Secured Operating System

Sistema operacional seguro Azure Sphere OS que combina as melhores práticas da Microsoft e da comunidade Open Source, criando uma plataforma confiável para uma nova experiência em IoT.

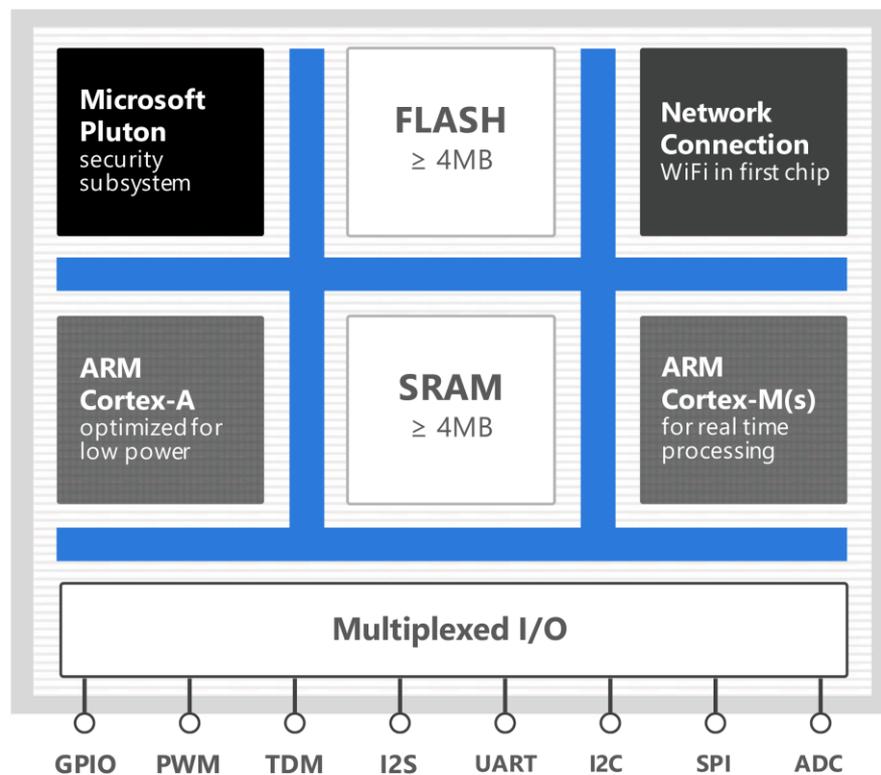

Arquitetura do Azure Sphere MCU

Microsoft Pluton Security Subsystem –
Root of Trust

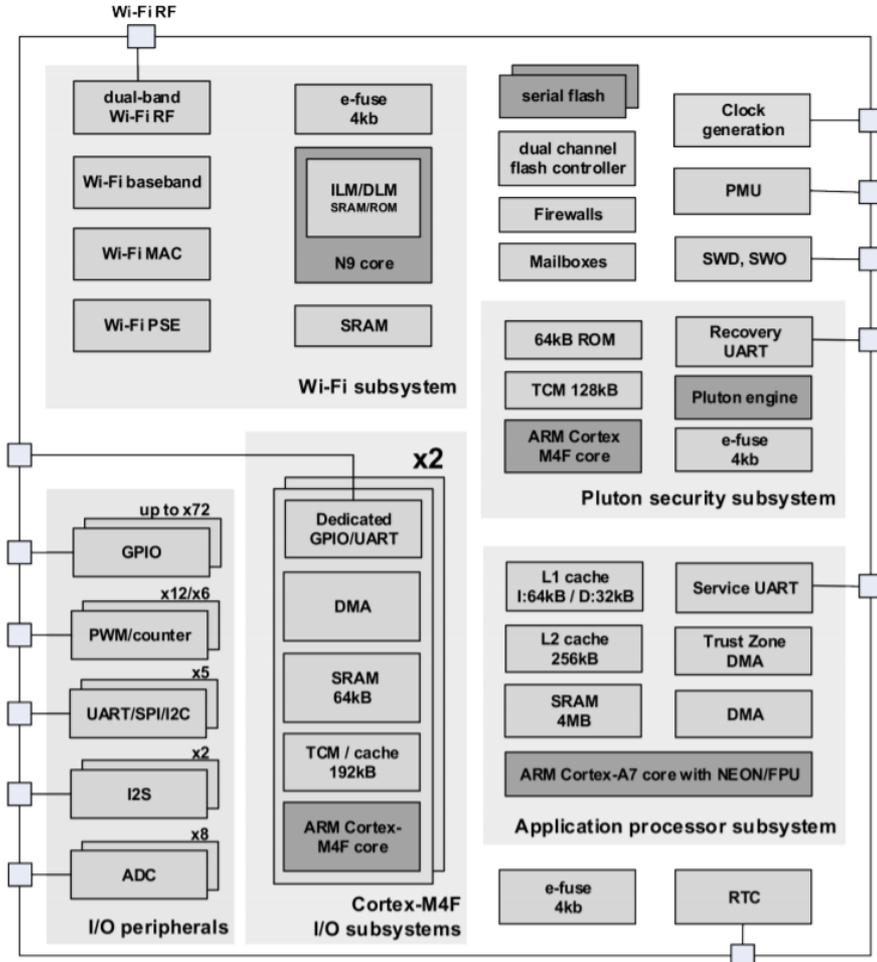

ARM Cortex-A provê isolamento de processos através do gerenciamento de unidades de memória. Azure Sphere OS cria containers para as aplicações que utilizam espaços de memória reservados.

2x ARM Cortex-M é o MCU, que executa o processamento em real time.

THE DEVELOPER'S CONFERENCE

➤ ARM Cortex A7 NEON FPU

- 64kB L1 instruction cache
- 32kB L1 data cache
- 256kB L2 cache,
- 4MB system memory for the Azure Sphere operating system and user applications

➤ 2x ARM Cortex M4 cores

- 192kB TCM (Tightly-Coupled Memory)
- 64kB SRAM
- FPU Floating Point Unit

➤ Pluton Security Subsystem

- ARM Cortex-M4F security processor
- 128kB secured TCM
- 64kB secured mask ROM bootloader

➤ Wi-Fi

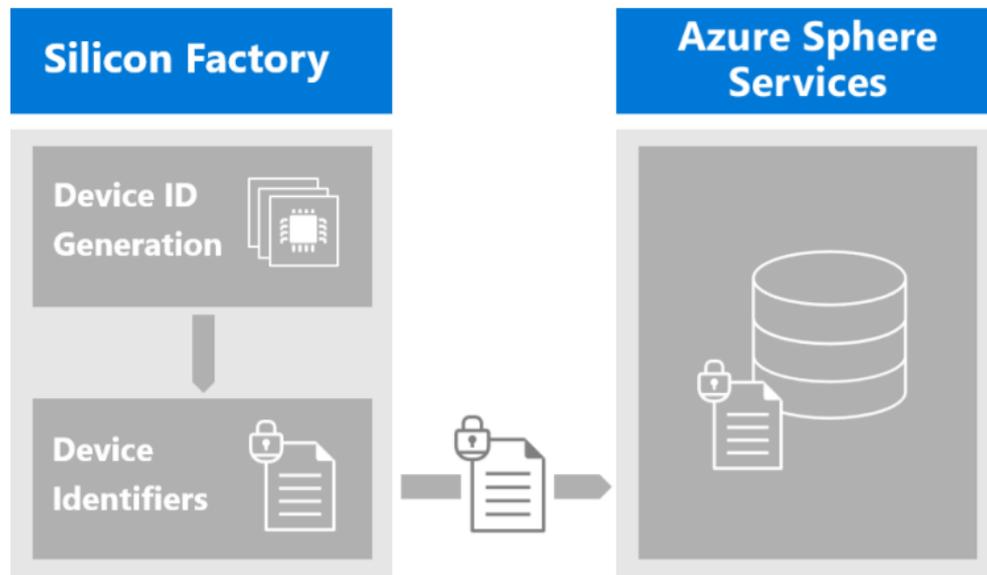

- Processador dedicado N9 32-bit RISC core
- IEEE 802.11 a/b/g/n
- Bandas de 2.4GHz e 5GHz

Geração do Device ID no Azure Sphere

THE
DEVELOPER'S
CONFERENCE

- Cada dispositivo possui um identificador único;
- O ID é gerado no processo de fabricação do MCU;
- Microsoft possui o controle de todos os IDs dos dispositivos produzidos.

https://azure.microsoft.com/mediahandler/files/resourcefiles/azure-sphere-device-authentication-and-attestation-service/Device_Authentication_and_Attestation_Service.pdf?v=cba244cabba1e2c8d7ceb8f3389d4c7eb8a97d1eacae2cdc e17d73dc686a476b

Comprovação remota

- Ocorre durante o processo de autenticação
- Azure Sphere assina digitalmente um conjunto de informações para provar que o dispositivo é original;
- Dados são enviados para o Device Authentication and Attestation no Azure;
- Retorna um certificado de curta duração atestando que é um dispositivo original.

THE
DEVELOPER'S
CONFERENCE

Device Authentication and Attestation

Is this device genuine?
Is this device trusted?

Status de Suporte MT3620

<https://docs.microsoft.com/pt-br/azure-sphere/hardware/mt3620-product-status>

THE
DEVELOPER'S
CONFERENCE

- **Suportado**
 - 76 GPIO mapeados apenas para o ARM Cortex-A7
 - Serial UART 1.200 a 2.000.000 bauds + 32 bytes de buffer
 - SPI 40 MHz – 2 dispositivos subordinados
 - I2C 100kHz a 1 MHz
 - Subsistema Wi-Fi
 - 5MB RAM – 4MB flash para o ARM Cortex-A7 (pode ser solicitado com 16MB flash SPI)
- **Não suportado** (por enquanto)
 - PWM e contadores de pulso
 - I2S (Inter-IC Sound)
 - ADC – 8 pinos
 - 2x ARM Cortex-M4F
 - Controle de energia
 - Detecção de Brownout

i You can specify credentials to container registries hosting module images. Listed credentials are used to retrieve modules with a matching URL. The Edge Agent will report error 500 if it can't find a container registry setting for a module.

Container Registry Settings

NAME	ADDRESS	USER NAME	PASSWORD

i An IoT Edge module is a Docker container you can deploy to IoT Edge devices. It communicates with other modules and sends data to the IoT Edge runtime. Using this UI you can import Azure Service IoT Edge modules or specify the settings for an IoT Edge module. Setting modules on each device will be counted towards the quota and throttled based on the IoT Hub tier and units. For example, for S1 tier, modules can be set 10 times per second if no other updates are happening in the IoT Hub.

The screenshot displays the Microsoft Azure portal interface for configuring IoT Edge Custom Modules. The main window is titled "Set modules" and is divided into three steps: "1 Add Modules (optional)", "2 Specify Modules (optional)", and "3 Review Deployment".

On the left, under "Deployment Modules", there is a table with columns for "NAME" and "DESIRED STATUS". The table is currently empty, showing "No Modules Found".

On the right, the "IoT Edge Custom Modules" configuration panel is open. It contains several fields and options, all highlighted with red boxes:

- Name:** A text input field.
- Image URI:** A text input field.
- Container Create Options:** A large text area for defining container options.
- Restart Policy:** A dropdown menu set to "always".
- Desired Status:** A dropdown menu set to "running".
- Set module twin's desired properties:** A checkbox that is unchecked.
- properties.desired:** A text area containing the JSON object `{}`.

At the bottom of the configuration panel, there is a "Save" button. The main "Set modules" window has "Previous" and "Next" buttons at the bottom.

Azure IoT Starter Kit (AZ3166)

The screenshot displays the Visual Studio Code interface with the Azure IoT Device Workbench extension installed. The left sidebar shows the Extensions view with a search bar and a list of installed and recommended extensions. The main editor area shows the extension's details page, including its name, publisher (Microsoft), version (0.2.6), and a description. Below the details, there are tabs for chat, on gitter, build, and passing. A terminal window at the bottom shows the output of a connection attempt to a COM port, which failed due to the port not being open.

Azure IoT Device Workbench ^{preview} for Visual Studio Code

chat on gitter build passing

Welcome to **Azure IoT Device Workbench** ^{preview} for Visual Studio Code! The Azure IoT Device Workbench extension makes it easy to code, build, deploy and debug your IoT project with multiple Azure services and popular IoT development boards .

Prerequisites

Azure IoT Device Workbench aims to support multiple popular IoT development boards and kits. It currently supports following IoT hardware:

PROBLEMS OUTPUT DEBUG CONSOLE **TERMINAL**

The screenshot shows a web browser window with the URL `https://github.com/IoTDevEnvExamples/DevKitKeywordSpotter/blob/master/README.md`. The page content includes:

- File statistics: 321 lines (249 sloc), 15.6 KB
- Navigation buttons: Raw, Blame, History
- Section title: **Keyword Spotting on IoT DevKit with ELL**
- Text: "In this tutorial, you learn how to do some simple voice recognition locally on your IoT DevKit without using a cloud service. It records your voice, detects what you said from a fixed list of 30 keywords, and shows the result on the DevKit screen."
- Text: "You can watch the following video to have a deep understanding of what it does."
- Video thumbnail: A video titled "Running AI on tiny IoT device with ELL" showing two men in a studio setting. One man is pointing at a screen displaying a diagram of the AI workflow, while the other stands next to a laptop. The video is part of "The IoT Show".

Embedded Learning Library

<https://microsoft.github.io/ELL/>

THE
DEVELOPER'S
CONFERENCE

The Embedded Learning Library (ELL) allows you to design and deploy intelligent machine-learned models onto resource constrained platforms and small single-board computers, like Raspberry Pi, Arduino, and micro:bit. The deployed models run locally, without requiring a network connection and without relying on servers in the cloud. ELL is an early preview of the embedded AI and machine learning technologies developed at Microsoft Research.

We built ELL for makers, technology enthusiasts, students, entrepreneurs, and developers who aspire to build intelligent devices and AI-powered gadgets. Our tools, our code, and all of the other resources available on this website are free for anyone to adapt and use (for details, see licensing below). Just keep in mind that ELL is a work in progress and that we expect it change rapidly, including breaking API changes.

ELL is a software library and an accompanying set of software tools, written in modern C++, with an optional interface in Python. Download ELL from our GitHub repository, either as a zip file, or with the following command:

```
git clone https://github.com/Microsoft/ELL.git
```

While the goal of ELL is to deploy software onto resource constrained platforms and small single-board computers, most of the interaction with ELL occurs on a laptop or desktop computer (Windows, Ubuntu Linux, or macOS). Technically, you can think of ELL as a cross-compiler for embedded intelligence - the compiler itself runs on your laptop or desktop computer and the machine code that it generates runs on your single-board computer.
